Mandatory, and *moving*

Climate reporting obligations across Asia-Pacific: who is captured, when they file, and what has changed since the deadlines were first set. Ten exhibits, twenty sources, and both dates wherever a deadline has been revised.

IN THIS BRIEFING

Three markets · 10 exhibits · 20 sources

JURISDICTIONS COVERED

Australia · Singapore · India

STANDARDS REFERENCED

AASB S1/S2 · IFRS S1/S2 · BRSR · TCFD · NGFS

JULY 2026 · DATA AS AT 31 JULY 2026 · RGI-2026-01

What is in this briefing.

–	Introduction	Why the date matters more than the standard	03
–	Key findings	Six figures that define the obligation	04
–	Executive summary		05
01	The obligation	Thresholds, phase-in dates and assurance across three markets	06
02	The evidence	What supervisors have measured, and what it showed	14
03	The capability gap	Where the obligation and the available tooling diverge	21
–	What this means	Five actions, by cohort and date	23
–	About the research	Scope, method and limitations	24
–	Endnotes	Twenty sources	25

HOW TO READ THIS

Each exhibit carries its own source line and, where relevant, a note on what is excluded. Superscripts resolve to the endnotes. Dates that have been revised show both the original and the current position.

WHAT IS NOT COVERED

The European CSRD, the United States, and voluntary frameworks except where a mandatory obligation references them. This is a compilation of published regulatory positions, not a survey of company practice.

The date, not the standard, sets the work.

Between January 2025 and July 2027, climate disclosure across three Asia-Pacific markets moves from a voluntary exercise to a filed obligation, and then to an audited one. The standards themselves are converging: Australia's AASB S2 is built on IFRS S2,[3] and Singapore's roadmap is explicitly ISSB-aligned.[6] What differs between markets is not the substance of what must be disclosed, but which entities are captured and when they first file.

That distinction carries more weight than it appears to. A first reporting period determines when an entity needs a defensible emissions baseline, and assurance tests prior-year comparatives. An entity that begins measuring in the year it reports has no history to compare against.

SCOPE OF THIS BRIEFING

The obligations as they stood at 31 July 2026 — thresholds, phase-in dates, the assurance ramp, and the supervisory stress tests now sitting behind them. Where deadlines have been revised, both the original and the current date are shown. Every figure is referenced to the endnotes on page 24.

Six figures define the obligation.

Three markets have set mandatory climate disclosure on different gating rules and different dates. Two of those dates have already moved once. These are the six numbers that determine which entities are captured, when they first file, and what the requirement costs to meet.

A$50m

REVENUE AT WHICH AUSTRALIAN ENTITIES ARE CAPTURED FROM JULY 2027[1]

FY2030

REVISED FIRST REPORTING YEAR FOR SINGAPORE'S LARGE NON-LISTED COMPANIES, FROM FY2027[5]

S$45

SINGAPORE CARBON TAX PER TCO_2E FROM 2026, RISING FROM S$5 IN 2023[9]

36

JURISDICTIONS ADOPTING OR FINALISING ADOPTION OF ISSB STANDARDS, REPRESENTING ABOUT 60% OF GLOBAL GDP[11]

Converging standards, diverging timetables.

Three markets now require climate disclosure on a statutory or listing-rule basis. Australia legislated it into the Corporations Act with effect from 1 January 2025;[1] Singapore set an ISSB-aligned roadmap for listed issuers and large non-listed companies;[6] India has required BRSR of its top 1,000 listed companies by market capitalisation since FY2022–23.[10]

The requirements are more alike than different. All three inherit the TCFD architecture of governance, strategy, risk management, and metrics and targets. An emissions inventory built once to the GHG Protocol supports all three filings. The cost sits in translation between disclosure regimes, not in the underlying measurement.

Timetables, however, have proved unstable. In August 2025 ACRA and SGX RegCo deferred most Singapore deadlines, moving large non-listed companies from FY2027 to FY2030 and their assurance obligation from FY2029 to FY2032.[5] The direction of travel did not change; the runway did. Deferral is not withdrawal, and entities that treat it as such will arrive at the revised date with the baseline problem they would have had at the original one.

Two developments have made the requirement harder rather than easier. Assurance escalates from limited to reasonable over all Australian climate disclosures from 1 July 2030.[4] And the NGFS raised projected physical-risk damages two- to four-fold in its November 2024 scenarios,[14] so scenario analysis run on earlier vintages now returns a materially different answer on the same inputs.

01

The obligation

Which entities are captured in each market, when they first report, and what the standards require of them. Where deadlines have been revised, both dates are shown.

07 Three markets, three gating rules

08 Australia: the threshold falls tenfold

09 Australia: what AASB S2 asks for

10 Singapore: MAS on transition planning

11 Singapore: deferred, not withdrawn

12 Singapore: the carbon price

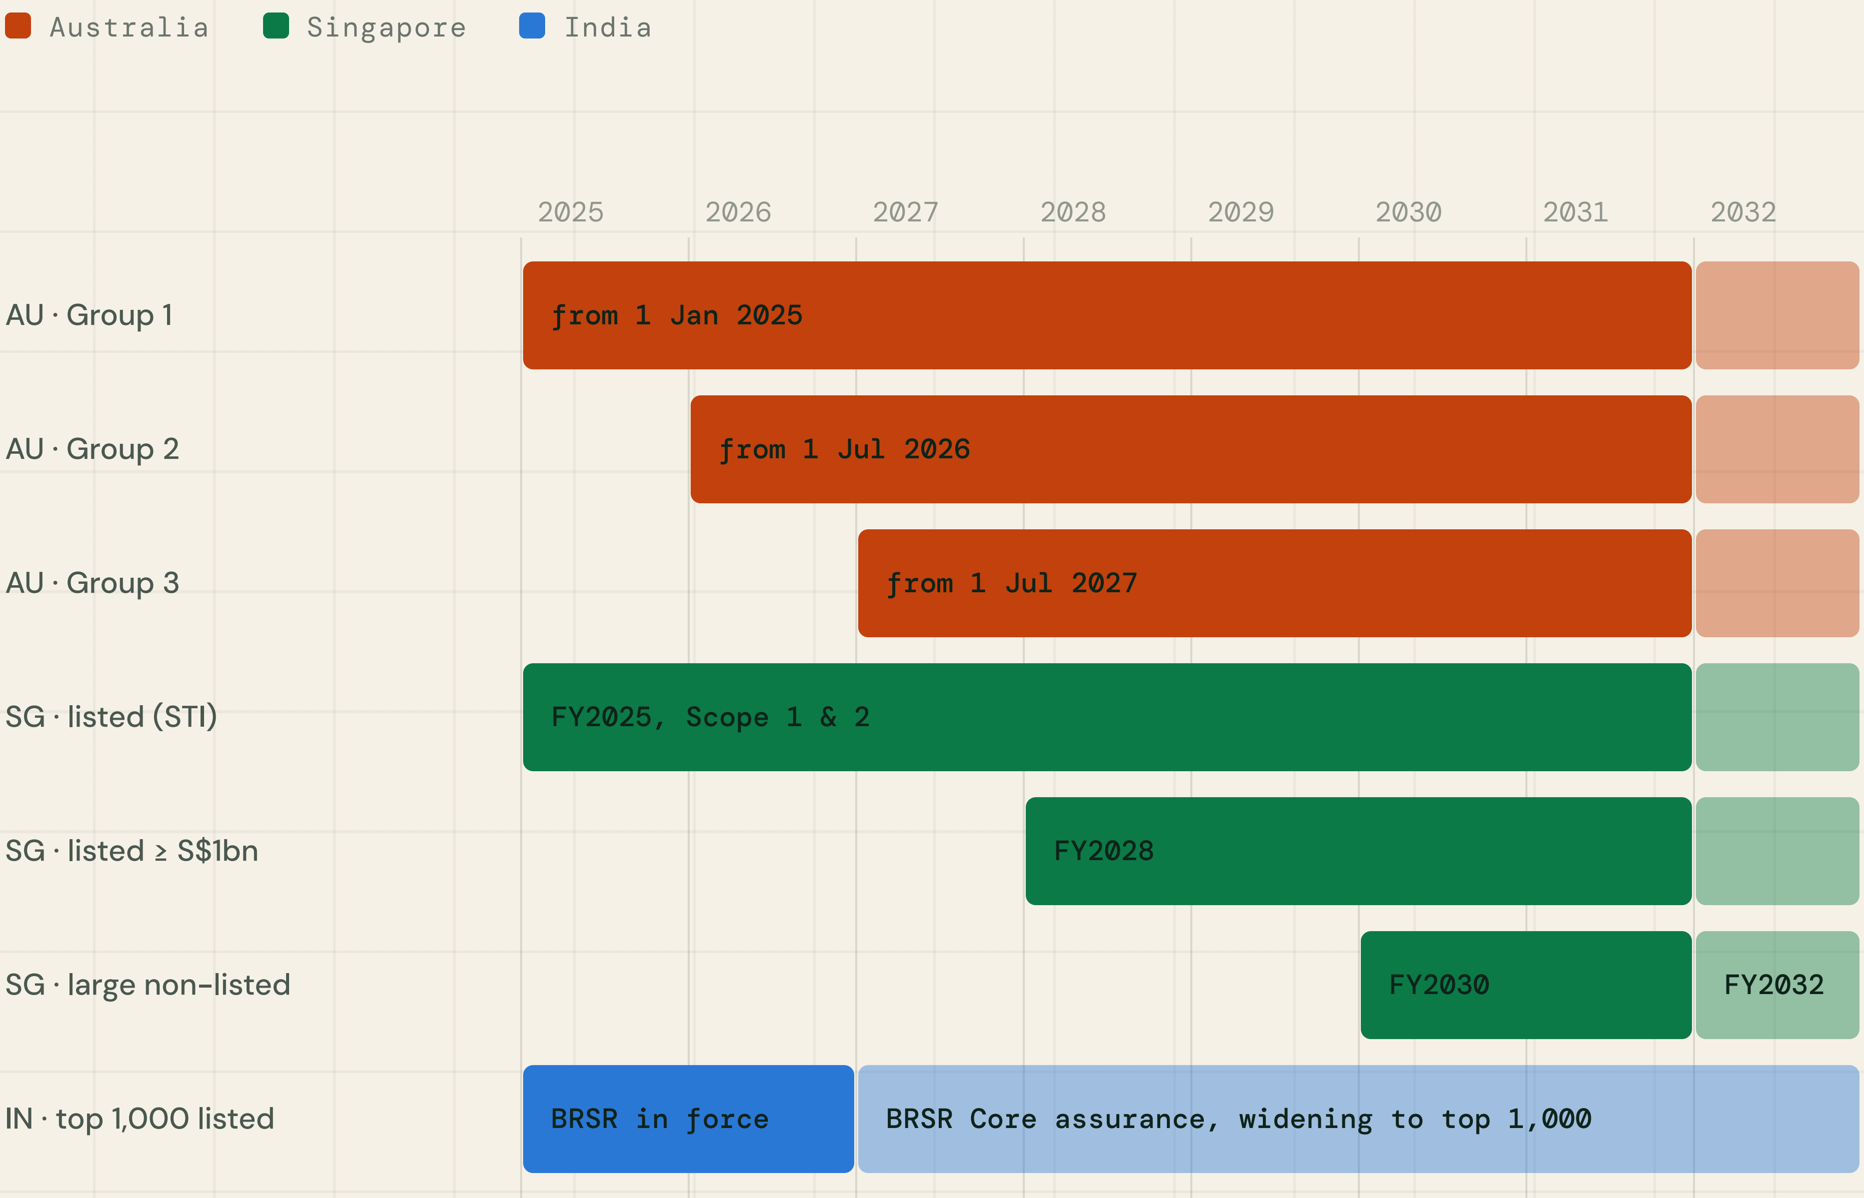
13 India: assurance widens down the ranking

Three markets, three gating rules.

Exhibit 1

No two markets capture the same entities, and none phase in together.

First mandatory reporting period by cohort. Solid indicates mandatory disclosure in force; translucent indicates the assurance obligation.



Note: Australian periods are annual reporting periods beginning on or after the date shown. Singapore and Indian cohorts are stated by financial year.

Source: Treasury Laws Amendment Act 2024; ACRA and SGX RegCo, August 2025; SEBI; ReGenesis Impact analysis

REGENESIS IMPACT

Australia gates on **company size**,[1] Singapore on **listing status and market capitalisation**,[5] India on **market-capitalisation rank**.[10] An entity operating in all three can face three different first-report dates for one emissions inventory.

The threshold falls by an order of magnitude.

Exhibit 2

By July 2027 the Australian regime reaches entities ten times smaller than in its first year.

Size thresholds by group. An entity is captured if it meets at least two of the three criteria.

COHORT	REVENUE	GROSS ASSETS	EMPLOYEES	FIRST PERIOD BEGINS
Group 1	≥ A$500m	≥ A$1bn	≥ 500	on/after 1 Jan 2025
Group 2	≥ A$200m	≥ A$500m	≥ 250	on/after 1 Jul 2026
Group 3	≥ A$50m	≥ A$25m	≥ 100	on/after 1 Jul 2027

Note: entities registered under the National Greenhouse and Energy Reporting Act are captured irrespective of size; asset owners with A$5bn or more under management are captured from Group 2.

Source: Treasury Laws Amendment Act 2024, Schedule 4; ASIC Regulatory Guide 280

REGENESIS IMPACT

Group 1 broadly describes entities that already carry a sustainability function. Group 3, at A$50m of revenue and 100 employees, generally does not.[1,2]

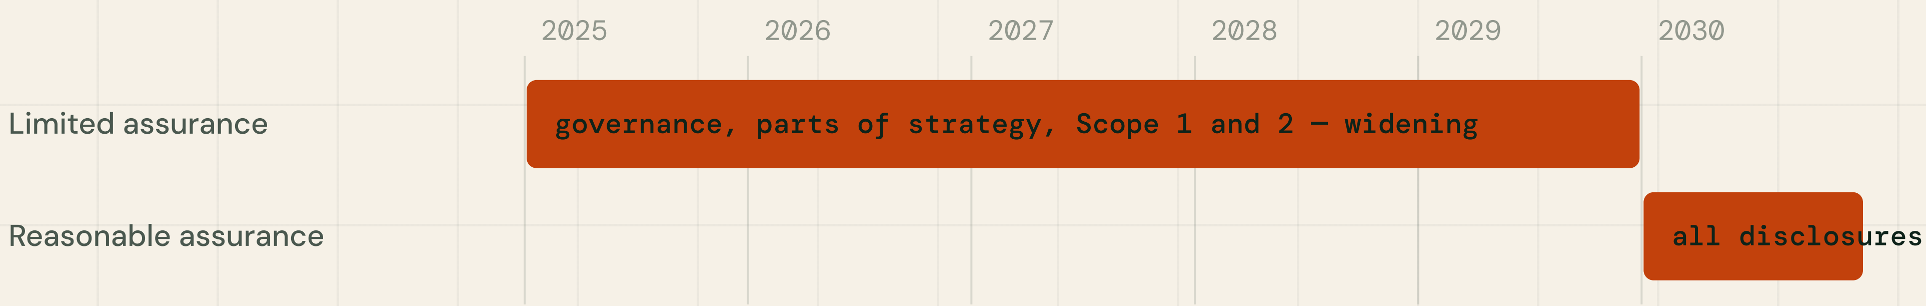
What AASB S2 asks for, and when it is audited.

PILLAR	REQUIREMENT
Governance	Board and management processes, controls and procedures for overseeing climate-related risks and opportunities.
Strategy	Material risks and opportunities, anticipated financial effects, transition plans, and climate scenario analysis as a resilience assessment.
Risk management	Processes to identify, assess, prioritise and monitor climate-related risks.
Metrics and targets	Scope 1 and 2 emissions from year one; material Scope 3 emissions from year two.

Exhibit 3

Assurance escalates from limited to reasonable over all climate disclosures by 2030.

Assurance obligation for Australian reporters, annual periods beginning on or after the date shown.



Source: AUASB, ASSA 5000 and ASSA 5010; AASB S2

REGENESIS IMPACT

ASIC has provided a fixed three-year, regulator-only liability window from 1 January 2025 covering Scope 3, scenario analysis, transition plans and forward-looking statements. It is not a general immunity, and it does not extend to statements made outside the sustainability report.[2]

Transition planning became a supervisory expectation.

MAS issued guidelines on transition planning for banks, insurers and asset managers on 5 March 2026, effective September 2027 after an 18-month transition period. They sit as an addendum to the existing environmental risk management guidelines rather than replacing them.[7]

EXPECTATION	WHAT IT REQUIRES
Risk-proportionate process	A transition-planning process proportionate to the risk profile of the business model and the local circumstances of operations.
Engagement over withdrawal	Engaging and supporting clients through transition rather than withdrawing financing from exposed sectors.
Multi-year horizon	A forward-looking view covering both physical and transition risk.

SECOND-ORDER EFFECT

A supervised lender or insurer assessed on its portfolio's transition will put those questions to its customers. For companies outside the scope of mandatory reporting, this is the more probable route by which disclosure becomes a requirement. MAS found in 2023 that a disorderly transition would be materially more costly for banks and insurers than an early, orderly one.[8]

Deferral is not withdrawal.

Exhibit 4

Every Singapore cohort moved back, some by five years.

First reporting year before and after the revision announced 25 August 2025.

COHORT	ORIGINAL	REVISED
Large non-listed companies revenue ≥ S$1bn and assets ≥ S$500m	FY2027, Scope 1 and 2	FY2030
Large non-listed companies external limited assurance	FY2029	FY2032
Listed, non-STI, ≥ S$1bn market cap other ISSB-based disclosures	FY2025	FY2028
Listed, non-STI, < S$1bn market cap	FY2025	FY2030

Note: ACRA and SGX RegCo cited the uncertain global economic landscape and varying levels of company readiness.

Source: ACRA and SGX RegCo, 25 August 2025; roadmap of 28 February 2024

REGENESIS IMPACT

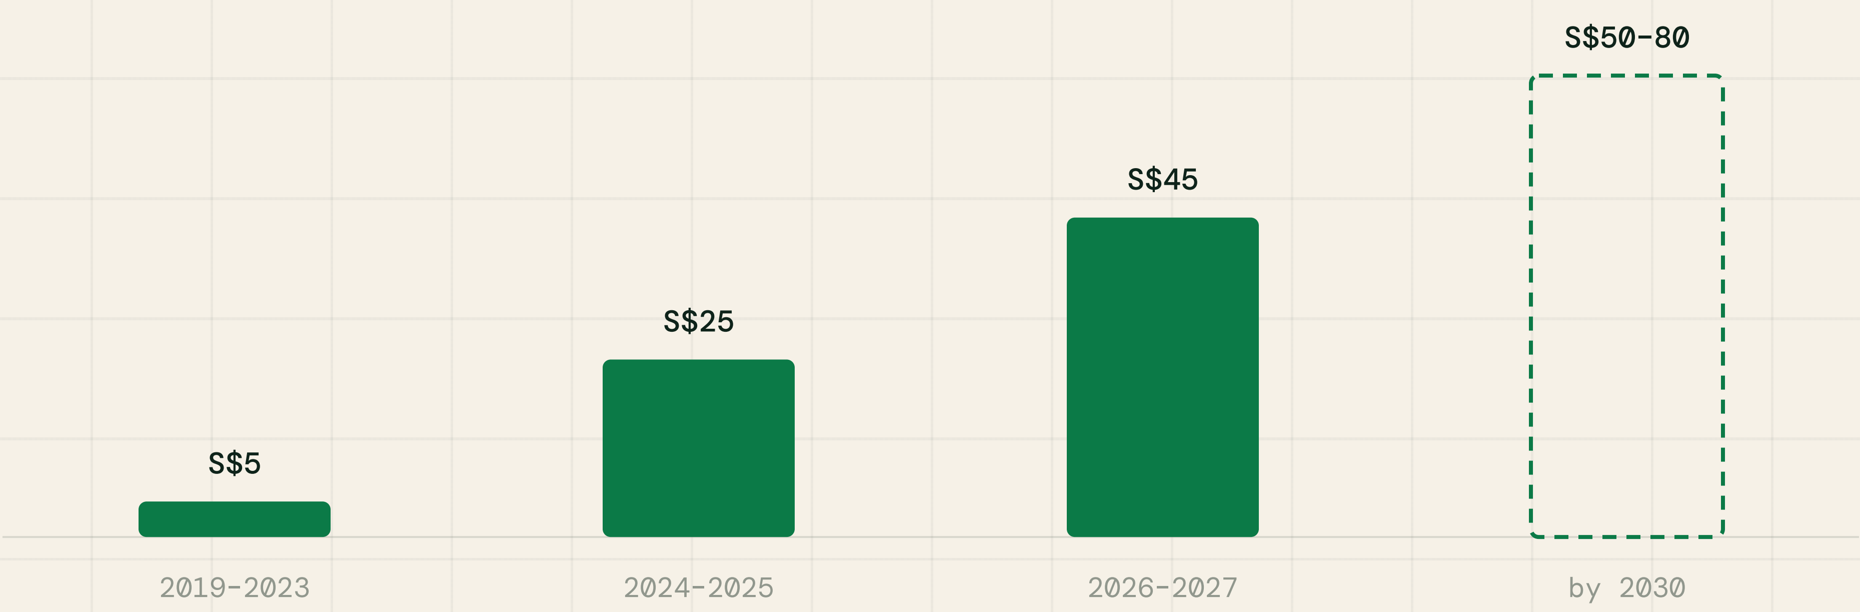
Assurance tests prior-year comparatives. An entity that begins measuring in FY2030 reaches its first assured report with the same absence of history it would have had in FY2027.[5]

The price signal moved faster than the deadlines.

Exhibit 5

Singapore's carbon tax rose ninefold between 2023 and 2026.

Headline rate, S$ per tonne of CO_2 equivalent, for facilities emitting 25,000 tCO_2e a year or more.



Note: the 2030 range is stated policy intent and is not legislated, shown here as a dashed outline. Up to 5% of taxable emissions may be offset with eligible international carbon credits.

Source: National Climate Change Secretariat; Ministry of Sustainability and the Environment

REGENESIS IMPACT

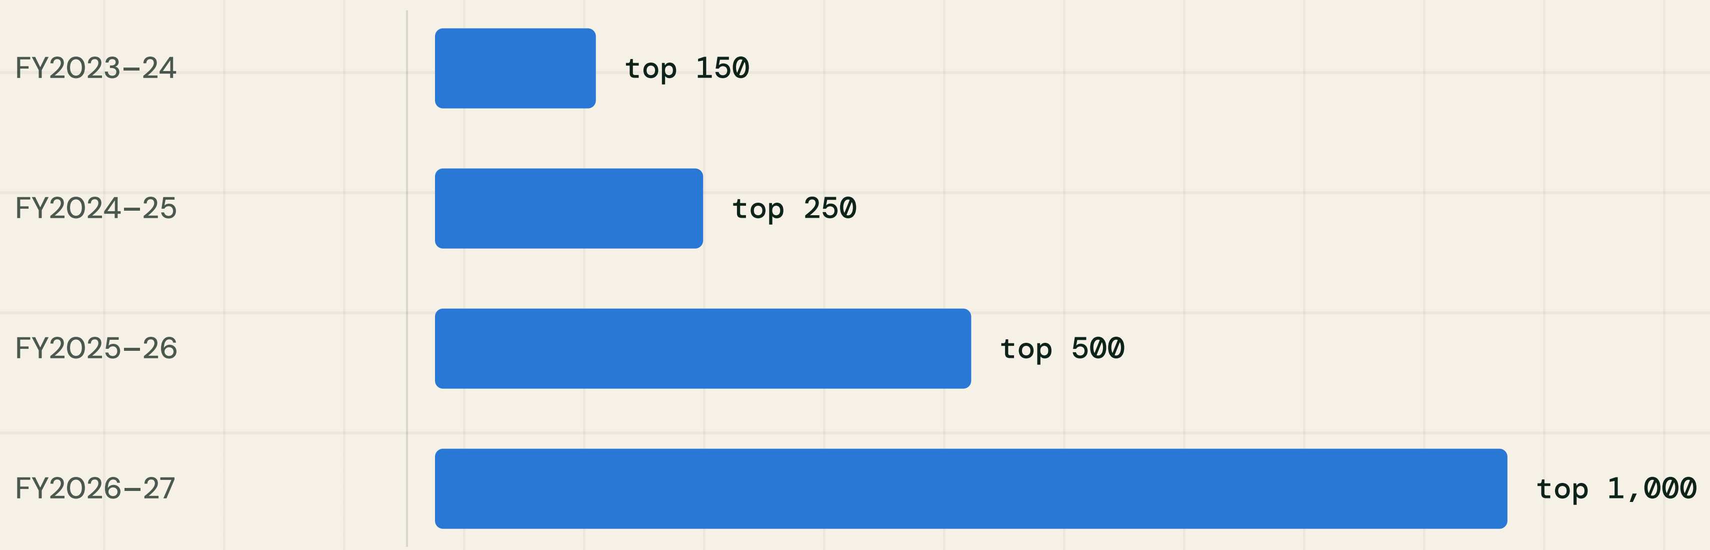
The Carbon Pricing Act has been in force since 1 January 2019. The rate applies to facility-level emissions and is independent of the disclosure obligations above, though both draw on the same inventory.[9]

Assurance widens down the ranking.

Exhibit 6

BRSR Core assurance reaches the full top 1,000 by FY2026–27.

Companies subject to BRSR Core assurance, by market-capitalisation rank and financial year.



Note: Base: the top 1,000 listed companies by market capitalisation, for which BRSR has been mandatory since FY2022–23.

Source: SEBI, BRSR and BRSR Core assurance framework

REGENESIS IMPACT

BRSR is not an ISSB standard. It carries its own KPI structure and a broader social dimension, so a group reporting in all three markets maintains one emissions inventory against three disclosure structures.[10]

02

The evidence

What prudential regulators have now measured, and what those exercises returned. These are the published numbers behind the requirement, not projections commissioned to support it.

15 The estimate that moved supervisory opinion

16 APRA prices the protection gap

17 The four reference scenarios

18 What separates a plan from a target

19 Disclosure quality and capital allocation

20 Three carbon-market figures

The estimate that moved supervisory opinion.

PEER-REVIEWED, NATURE, APRIL 2024

The world economy is already committed to a reduction in global income of approximately **19% by 2050** relative to a baseline without climate change — around **US$38 trillion a year** in damages, within a likely range of US$19–59 trillion.[15]

The finding matters to supervisors because the committed portion is largely independent of near-term emissions choices. It describes damage already priced into the physical system rather than damage contingent on future policy.

2–4×

INCREASE IN PROJECTED PHYSICAL-RISK DAMAGES, NGFS PHASE V AGAINST EARLIER VINTAGES[14]

>24%

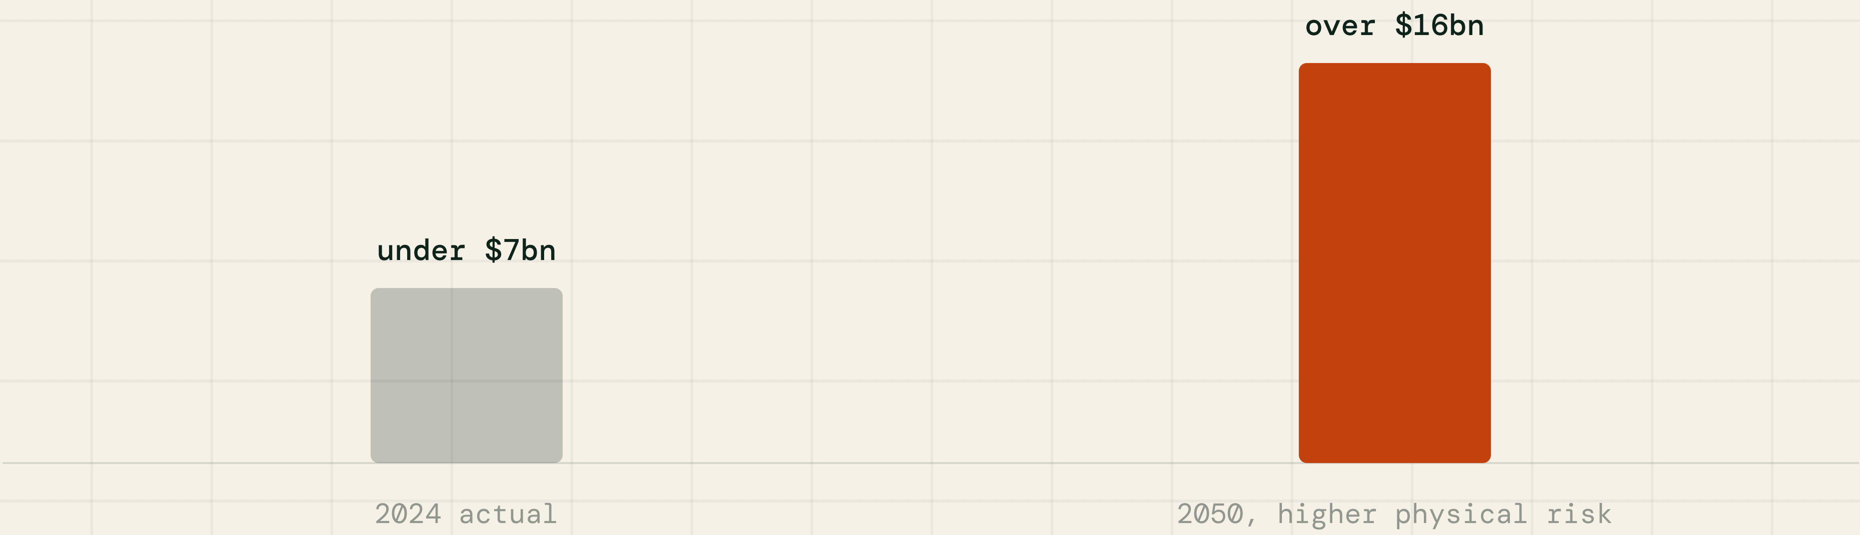
OF GLOBAL EMISSIONS COVERED BY A CARBON PRICE, 2024[20]

A regulator put a number on the protection gap.

Exhibit 7

Expected weather-peril losses more than double by 2050 under the higher physical-risk scenario.

Expected national annual weather-peril losses, A$ billion.



Note: APRA modelled two severe but plausible scenarios to 2050. The 2024 baseline is shown recessive; the projection is the finding.

Source: APRA, “Mind the Gap: an insurance climate vulnerability assessment”, March 2026

REGENESIS IMPACT

1 in 4

HOUSEHOLDS IN FREESTANDING PROPERTIES PROJECTED UNINSURED BY 2050, FROM 1 IN 7 TODAY[12]

2022

BANKING ASSESSMENT OF THE FIVE LARGEST BANKS FOUND LOSSES CONCENTRATED IN NORTHERN-AUSTRALIA MORTGAGES AND TRANSITION-EXPOSED LENDING[13]

Scenario analysis is a resilience test, not a narrative.

Exhibit 8

The reference scenarios pair transition risk against physical risk.

NGFS Phase V scenario families, version 5.0, November 2024.

Physical risk

HOT HOUSE WORLD

Current Policies

Insufficient global action
Severe physical risk, low transition risk

TOO LITTLE, TOO LATE

Fragmented World

Delayed and divergent policy
Both risks elevated

ORDERLY

Net Zero 2050

Early, gradually stringent policy
Both risks relatively subdued

DISORDERLY

Delayed Transition

Late, abrupt policy action
High transition risk in exposed sectors

Transition risk

Source: NGFS, Phase V long-term climate macro-financial scenarios, November 2024

REGENESIS IMPACT

AASB S2 requires scenario analysis to assess climate resilience, by an approach commensurate with the entity's circumstances.[3] Because Phase V raised projected physical damages two- to four-fold, an assessment run on an earlier vintage will not reproduce.[14]

A target is not a transition plan.

The UK Transition Plan Taskforce framework, published October 2023, sets out what a disclosed plan is expected to contain. Its materials now sit with the IFRS Foundation, aligning it to the ISSB baseline that Australia and Singapore both reference.[16]

ELEMENT	WHAT IT IS EXPECTED TO CONTAIN
Ambition	A strategic objective with interim targets, rather than a 2050 endpoint alone.
Action	The decisions in products, operations, policy and finance that deliver it.
Accountability	Governance, remuneration linkage, skills, and reporting against milestones.
Financial resourcing	The capital allocation supporting the plan.

THE COMMON TEST

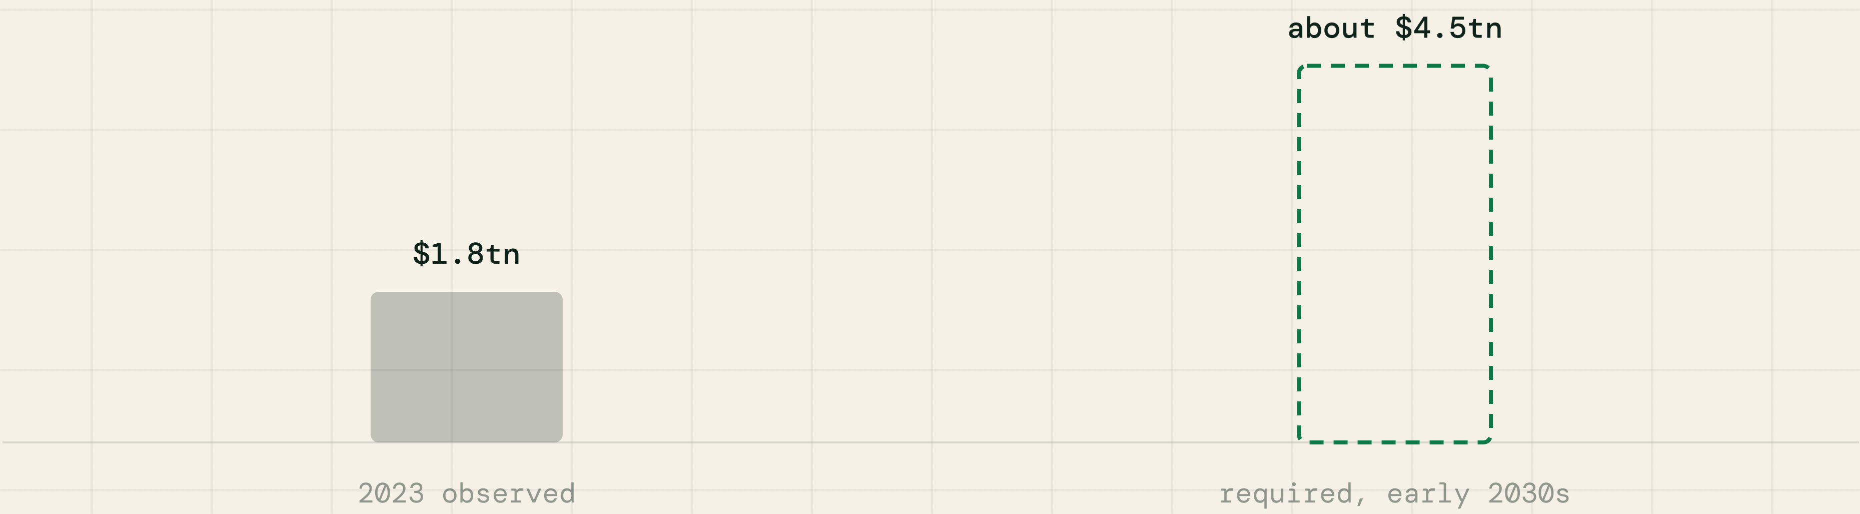
AASB S2 and the MAS guidelines converge on the same requirement: that a plan can be traced to an emissions baseline, a scenario run and a capital decision. Under mandatory reporting, a plan that cannot be traced is a disclosure exposure rather than a communications one.[3,7]

Disclosure quality gates capital allocation.

Exhibit 9

Required clean-energy investment is roughly two and a half times the level observed in 2023.

Annual global clean-energy investment, US$ trillion.



Note: the required figure is a modelled pathway, not observed investment, and is shown as a dashed outline.

Source: International Energy Agency, Net Zero Roadmap, September 2023

REGENESIS IMPACT

More than 80% of clean-energy investment currently occurs in advanced economies and China. Annual capital spending in emerging and developing economies excluding China would need to expand more than sevenfold, to above US$1 trillion a year, by the end of this decade.[17]

Three carbon-market figures, three different questions.

Exhibit 10

Widely quoted carbon-market totals measure different things and are not interchangeable.

Selected 2024 measures, with the basis of each stated.

MEASURE	2024 FIGURE	WHAT IT COUNTS
Voluntary market, transaction value	US$535m	Value of reported transactions, down 29% from US$723m in 2023[18]
Voluntary market, whole-market valuation	about US$1.5bn	A different methodology applied to the same market[19]
Carbon-pricing revenue	over US$100bn	Emissions trading schemes and carbon taxes — compliance, not voluntary[20]
Credits retired	180 million	The measure closest to genuine demand[19]
Unretired inventory	about 1 billion	Supply overhang weighing on price[20]

Note: figures are reported on the basis used by each issuing body and are not combined here.

REGENESIS IMPACT

03

The capability gap

The thresholds have fallen faster than the supporting tooling has adapted. This section sets out where the two diverge, and for whom.

22 The obligation scaled down; the tooling did not

23 Five actions, by cohort and date

The obligation scaled down. The tooling did not.

Australia's Group 3 floor is A$50m of revenue and 100 employees from July 2027.[1] Singapore's large non-listed cohort is defined at S$1bn of revenue and S$500m of assets by FY2030.[5] Both capture entities well below the profile for which established reporting software was designed.

What is required

An emissions inventory to the GHG Protocol, material Scope 3 by year two, quantified scenario analysis, a transition plan, and an evidence trail that survives limited and then reasonable assurance.[3,4]

What is typically available

A finance function without dedicated sustainability staff, advisory quotes scaled to larger balance sheets, and enterprise systems whose implementation period exceeds the time remaining before the first filing.

OBSERVATION

The standards were drafted with large filers in view and extended downward by threshold. The tooling was built for large filers and was not extended downward at all. For mid-market entities the binding constraint is not the regulation but the absence of anything proportionate with which to meet it.

Five actions, by cohort and date.

- **Confirm the cohort and the first reporting date.** Size in Australia, listing status and market capitalisation in Singapore, market-cap rank in India. Every subsequent decision follows from that date.[1,5,10]
- **Begin the Scope 1 and 2 inventory before the reporting year opens.** Assurance tests prior-year comparatives, so a baseline started in the reporting year carries no history.[4]
- **Scope the material Scope 3 categories now, ahead of measuring them.** Material Scope 3 falls due in year two in Australia; identifying which categories are material is separable from measuring them.[3]
- **Run scenario analysis on the current NGFS vintage.** Phase V raised projected physical damages two- to four-fold, and a qualitative narrative is unlikely to satisfy a resilience assessment.[14,3]
- **Retain the evidence trail from the first cycle.** Reasonable assurance over all climate disclosures applies in Australia from 1 July 2030; reconstructing an audit trail after the fact costs more than maintaining one.[4]

FOR JUNE 2026 AND FY2028 REPORTERS IN PARTICULAR

Each of these actions becomes cheaper with time and more expensive with delay. That asymmetry, rather than the regulation itself, is the argument for beginning in the current quarter.

Scope, method and limitations.

Scope. This briefing covers mandatory climate-disclosure obligations in Australia, Singapore and India, together with the prudential and scenario evidence cited by the regulators concerned. It does not cover the European CSRD, the United States, or voluntary frameworks except where an obligation references them.

Method. Figures are compiled from public announcements, standards and reports issued by the twenty bodies listed in the endnotes. Where an issuing body has revised a date, both the original and revised dates are shown. Where sources measure the same market on different bases — as with the voluntary carbon market — each figure is reported on its own basis and the bases are not combined. **Data as at 31 July 2026.**

LIMITATIONS

Two constraints should be read alongside the figures. First, this is a compilation of published positions, not a survey: it describes what regulators have stated, not what companies have done in response. Second, several timetables have already been revised once, and the August 2025 Singapore deferral demonstrates that further revision is possible. Dates should be verified against the issuing body before being relied on for a filing decision.

Who produced this briefing.

ReGenesis Impact builds disclosure tooling for companies in Australia, Singapore and India — the GHG inventory, the ISSB and BRSR disclosure structures, scenario analysis and assurance evidence described in this briefing. The tools are free to use and require no account to start.
